

Math Bugs Me! Protractor

Print this page onto a transparency. Then, cut along the rectangular dotted lines around the protractor (*for best results, do NOT cut the protractor shape itself out*). Now, you have an easy-to-use protractor.

When measuring an angle, place the cross-hairs on the vertex and line up the 0 along one leg of the angle with the other leg opening up into the protractor. You can always flip the protractor over or rotate your paper when measuring your angle. ☺
